

Reading Round-Up Dashboard

How to Run a Client Coverage Search

1. Open the Reading Round-Up Dashboard and sign in.
2. Click Client Coverage in the top menu.
3. Enter a short Report title, such as Client Name - August Coverage.
4. In Mention terms, enter the names that must appear in an article. Separate them with commas.
5. In Search queries, enter one Google-style search on each line.
6. Choose the From and To dates.
7. Click Run discovery and wait for the results.

What to enter

Field	Example	What it means
Report title	Acme Jewellery - August	A name for the finished report.
Mention terms	Acme, Acme Jewellery, Jane Smith	Names that confirm an article is relevant.
Search queries	"Acme Jewellery" "Jane Smith" luxury "Acme" diamonds	Different searches used to find possible coverage. Put each one on a new line.

Tips for better searches

1. Use quotation marks around exact client, founder, collection, or product names.
2. Add a helpful word such as luxury, jewellery, jewelry, or diamonds when a name is common.
3. Use 3-8 focused searches instead of one very long search.
4. Do not type dates into every query. The dashboard adds the date range for you.

What happens after discovery

1. Review the articles found by the system.
2. Select the articles that really mention the client, then continue to the country check.
3. Confirm or correct any countries that need review.
4. Click Finalize report, then download the PDF when it is ready.

How to Change the SerpApi or ZenRows Key

You do not need to edit any code. First copy the key from the provider's website, then paste it into GitHub.

Keep API keys private. Do not send them by email or chat, and do not paste them anywhere except the GitHub Secret box described below.

Option A: Change the SerpApi key

Copy the key from SerpApi

1. Open https://serpapi.com/users/sign_in in your browser.
2. Sign in using the Claire Adler company SerpApi account.
3. Open <https://serpapi.com/manage-api-key>.
4. Find the API key and click the copy button next to it. Leave this browser tab open until you finish the GitHub steps.

Paste it into GitHub

1. Open the TaterTot repository on GitHub and sign in.
2. Click Settings at the top of the repository.
3. In the left menu, click Secrets and variables, then Actions.
4. Under Repository secrets, find SERPAPI_API_KEY and click its pencil icon or Update.
5. Paste the key into the Secret box, then click Update secret.

Option B: Change the ZenRows key

Copy the key from ZenRows

1. Open <https://app.zenrows.com> in your browser.
2. Sign in using the Claire Adler company ZenRows account.
3. Open Settings and find the API Key section. If the key is shown on the dashboard or Playground, you can copy it there instead.
4. Click the copy button next to the API key. Leave this browser tab open until you finish the GitHub steps.

Paste it into GitHub

1. Return to the TaterTot repository on GitHub.
2. Go to Settings -> Secrets and variables -> Actions.
3. Under Repository secrets, find ZENROWS_API_KEY and click its pencil icon or Update.
4. Paste the key into the Secret box, then click Update secret.

Done. GitHub hides the saved value, so it is normal that you cannot see the key after saving. If you copied the wrong key, repeat the same steps and update the secret again.
